What is claimed is:

- 1. An implantable medical device with an external recharging coil, comprising:
 - a housing having an interior cavity, a proximal face, and an electrical feedthrough;
 - electronics carried in the housing interior cavity, the electronics configured to perform a medical therapy;
 - a rechargeable power source carried in the housing interior cavity and electrically coupled to the electronics; and,
 - a recharging coil centrally located and substantially carried on the housing proximal face and electrically coupled through the housing electrical feedthrough to the electronics and rechargeable power source.
- 2. The implantable medical device as in claim 1 wherein the electrical feedthrough includes a recharge feedthrough located on the housing proximal face.
- 3. The implantable medical device as in claim 1 wherein the recharging coil is mechanically attached to the housing.
- 5. The implantable medical device as in claim 1, further comprising at least one housing attachment detail.
- 6. The implantable medical device as in claim 1, further comprising a coil cover that carries the recharging coil and attaches to the housing.
- 7. The implantable medical device as in claim 6, further comprising at least one cover alignment detail.
- 8. The implantable medical device as in claim 6, further comprising at least one cover attachment detail.
- 9. The implantable medical device as in claim 6, further comprising a biocompatible polymer to create a hermetic seal between the coil cover and the housing.

- 10. The implantable medical device as in claim 6, further comprising a coil alignment carrier for carrying the coil, the coil alignment carrier positioned between the coil cover and the housing.
- 11. The implantable medical device as in claim 10 wherein the coil alignment carrier is hermetically sealed to the coil cover to form a coil assembly.
- 12. The implantable medical device with external recharging coil as in claim 1 wherein the recharging coil is attached to the housing by encapsulation with a polymer.
- 13. The implantable medical device as in claim 1 wherein the recharging coil is attached to the housing by overmolding with a polymer.
- 14. The implantable medical device as in claim 13, wherein the overmolding is accomplished in an in situ mold.
- 15. The implantable medical device as in claim 1 wherein the recharging coil is mechanically attached to the housing with a retention sleeve.
- 16. The implantable medical device as in claim 15 wherein the retention sleeve is hermetically sealed to the housing.
- 17. The implantable medical device as in claim 1 wherein the rechargeable power source is an electrical storage device.
- 18. The implantable medical device as in claim 1 wherein the rechargeable power source is a chemical storage device.
- 19. The implantable medical device as in claim 1 further comprising a telemetry coil carried in the housing interior cavity.
- 20. The implantable medical device as in claim 1 wherein the recharging coil is configured for multiplexing as a telemetry coil for communications between a programmer and the electronics.

- 21. The implantable medical device as in claim 1 wherein the medical device is selected from the group consisting of: a neuro stimulator, a pacemaker, a defibrillator, drug delivery pump, and a diagnostic recorder.
- 22. An implantable medical device with an external recharging coil, comprising:
 - a housing having an interior cavity, a proximal face, and an electrical feedthrough;
 - electronics carried in the housing interior cavity, the electronics configured to perform a medical therapy;
 - a rechargeable power source carried in the housing interior cavity and electrically coupled to the electronics; and,
 - means for recharging carried on the housing proximal face and operationally coupled to recharge the rechargeable power source; and
 - means for attaching the means for recharging coil to a position centrally located and substantially carried on the housing proximal face.
- 23. An implantable medical device with an external recharging coil, comprising:
 - a housing having an interior cavity, a proximal face, and an electrical feedthrough, the housing having at least one housing alignment detail;
 - electronics carried in the housing interior cavity, the electronics configured to perform a medical therapy;
 - a rechargeable power source carried in the housing interior cavity and electrically coupled to the electronics; and,
 - a recharging coil carried on the housing proximal face and electrically coupled through the housing electrical feedthrough to the electronics and rechargeable power source.
